Revision History

Version	Date	Reason of change	Maker
1.0	Jan 11, 2015	Initial release	Gill Wei
1.1	Mar 2, 2015	Add Wi-Fi Command Set	Marcus Chiou
1.2	Mar 10, 2015	Add BLE profile overview to introduction and BLE example for creating the sample by command	Gill Wei
1.3	Mar 27, 2015	Modify WIFI Command description	Marcus Chiou
1.4	Mar 30, 2015	Able to add BLE GATT 128bit vendor specific services/characteristics, modify advertise and add service command format.	Gill Wei
1.5	Jun 11, 2015	Modify 5.2 Procedure for creating an Profile about command description	Gill Wei
1.6	Sep 4, 2015	Merge mbed (mbed,BLE_API, RF51822) library, modify BLE name command, Wifi TCP/UDP blocking description	Gill Wei
1.7	Dec 9, 2015	Update GPIO PIN define to EVB version 3 Add BLE central mode API, WIFI device API, simplified command set.	Gill Wei
1.8	Jan 25, 2016	Add BLE data interrupt command; Chap 6.5 Wi-Fi data receive interrupt	Gill Wei
1.9	Jan 26, 2016	Remove Chap 6.5 Wi-Fi data receive interrupt, add Wifi data interrupt command; Modify Chap6 Wifi example program; Modify Chap5.3 BLE example procedure	Gill Wei
1.10	Feb 18, 2016	Modify BLE name, Wifi TCP send, UDP send format	Gill Wei
1.11	Feb 25, 2016	Modify TCP and UDP max data length	Gill Wei
1.12	April 25, 2016	Modify BLE Update command(add raw data type), Fix update	Gill Wei

		and readData command value length issue	
1.13	April 25, 2016	Fix Characteristic property setting issue,	Gill Wei
1.14	Sep 8, 2016	Add BLE Central mode commands	Silvia Chen
1 15	Sep 21 2016	Fix BLE connect command issue;	Silvia Chan
1.15	Sep 21, 2010	Modify the document for whole BLE module	Sirvia Chen
1.16	Oct 20, 2016	Update Section 3.1 and Section 3.2	Tsungta Wu
1.17	Nov 04 2016	Update Section 3.3, 3.5, 3.10, 3.11 and 3.13	Silvia Chan
	100 04, 2010	Remove Chap 6 Simplified command set	Sirvia Chen
1.18	Nov 11, 2016	Update Section 2.2 and 3.13	Silvia Chen

BLE Command Line Interface

Sheet 5 of 31

Bluetooth Low Energy Module Command Line Interface

A Command Line Interface (CLI) used to implement function of BLE Module.

1. Introduction

This document describes the function of each command within Delta mbed platform command line interface; include device configuration, BLE connection, sleep mode, and so on. This document also makes a demonstration of how to set up environment in PC and create a BLE profile in GATT server; below we use Glucose Profile setting as example, and list the typical procedure of standard profile setting.

Glucose profile is one of the officially defined BLE profile by Bluetooth official group SIG $_{z}$, which is abbreviated of Special Interest Group. See Reference 1.

Profile defines and explain stored data format, one profile contains one or several services, and each service contains data for communication.

Glucose profile composed of Glucose Service and Device Information Service(see Figure.1), which with specific data format, for example, the Glucose Service contains data as Time, Sequence number, Glucose concentration or other data related to Glucose measurement.

In this case, Delta platform with Glucose sensor can be seem as "Glucose Sensor , (see Figure.1), the Central Device, like smart phone or laptop, can act as "Glucose Collector , which collect and display the glucose data transmitted from glucose sensor. Collector and sensor can also be treated as "Central , and "Peripheral , Reference 2 have BLE GATT Service overview and have explain more detail.

BLE Command Line Interface

Sheet 6 of 31

Figure.1 Glucose role and services

After define all the data in Glucose sensor, let us see how BLE device set up the connection and transmit data, Figure.2 show how BLE device in and out from different state; only in connecting state, sensor data will transfer in profile-defined format.

Supported Platform

- DFCM-NNN40-EVB
- DFBM-NQ620-EVB

Reference

1. Glucose Profile https://developer.bluetooth.org/gatt/services/Pages/ServiceViewer.aspx?u=org.bluetooth.service.glucose.xml

2. SIG BLE GATT Service List <u>https://developer.bluetooth.org/gatt/services/Pages/ServicesHome.aspx</u>

BLE Command Line Interface

Sheet 7 of 31

2. Commands Status Responses

Whenever a command is received by device, an "OK , or "ERROR, response will be send back to host side. ERROR case will output with specific error string; OK will output with additional response for some specific commands.

2.1 OK

	ОК
	Function: All successful commands will respond with OK message
	Example:
	RESPONSE: OK <cr_lf></cr_lf>
	<cr_lf></cr_lf>
2.	2 ERROR

ERROR
Function: All failure commands will respond with ERROR response with mapping error message
Command Format: ERROR; <error message="">;</error>
Response Values:
Error Message:
"No such command",
"Wrong number of arguments",
"Argument out of range",
"Argument syntax error",
"No matched argument",
"Invalid state to perform operation",
"Function call fail"
"Function call fail"

BLE Command Line Interface

Sheet 8 of 31

Example:

RESPONSE: ERROR; Argument out of range;<cr_lf> <cr_lf>

BLE Command Line Interface

Sheet 9 of 31

3. BLE Commands Description

This section describes the detail function of each command, including command format, argument format, and command description.

3.1 GPIO

CONTROL GPIO PIN Function: Set or Clear a specific GPIO pin on BLE module Command Format: cynb gpio <LED-NO> <SET/CLEAR> Example: COMMAND: cynb gpio 1 set<cr> RESPONSE: <cr_lf> OK<cr_lf> <cr_lf>

Note: Available <LED-NO> number are 1, 2, 3 and 4 which are corresponded with LED1, LED2, LED3 and LED4 on the EVB respectively.

3.2 System Off

SLEEP MODE

Function: Go to system off mode, and then choose a specific pin; detect pin state change for wake up.

Command Format: cynb sleep <BUTTON-NO>

Example: COMMAND: cynb sleep 1<cr>
RESPONSE: <cr_lf> OK<cr_lf> <cr lf>

BLE Command Line Interface

Sheet 10 of 31

Note: Available <BUTTON-NO> number are 1, 2, 3 and 4 which are corresponded with BUTTON1, BUTTON 2, BUTTON 3 and BUTTON 4 on the EVB respectively. For NNN40 platform only BUTTON1 can be configured in this function.

3.3 Reset

RESET
Function: Reset BLE module.
Command Format: cynb reset
Example: COMMAND: cynb reset <cr> RESPONSE: <cr_lf> OK<cr_lf> SI E initialized<cr_lf></cr_lf></cr_lf></cr_lf></cr>
<cr_lf> OK;DELTA_CLI_V1.16;DFBM-NQ620<cr_lf> <cr_lf></cr_lf></cr_lf></cr_lf>
Note: Reset command will trigger BLE initialize function after reset success.

BLE Command Line Interface

Sheet 11 of 31

3.4 System Information

MODULE INFORMATION

Function: List system information stored in module, which included Firmware version and Module name

Command Format: cynb info

Example:

COMMAND: cynb info<cr>
RESPONSE: <cr_lf>
OK; DELTA_CLI_V1.7;DFCM-NNN40-DTOR; <cr_lf>
<cr_lf>

3.5 Device Name

SET BLE DEVICE NAME

Function: Set friendly name for BLE module.

Command Format: cynb name <LENGTH> <NAME>

Example:

COMMAND: cynb name 9 DELTA CLI<cr> RESPONSE: <cr If>

OK <cr If>

<cr lf>

Note: Please type string length including "space". Whenever initialize BLE module, default module name is "nRF5x".

BLE Command Line Interface

Sheet 12 of 31

GET BLE DEVICE NAME

Function: Get the current device name for BLE module.

Command Format: cynb name

Example:

COMMAND: cynb name<cr> RESPONSE: <cr_lf> OK; nRF5x;<cr_lf>

<cr_lf>

Note: Default name is "nRF5x"

3.6 Init BLE Central Mode

INIT BLE CENTRAL STACK

Function: Init BLE Central stack.

Command Format: cynb initBleCen

Example:

COMMAND: cynb initBleCen<cr>
RESPONSE: <cr_lf>
OK<cr_lf>
<cr_lf>

BLE Command Line Interface

Sheet 13 of 31

3.7 BLE Start Advertising

START DEVICE ADVERTISING

Function: Start BLE advertising with specific timeout and interval.

Command Format: cynb advStart <INTERVAL> <TIMEOUT>

Example: COMMAND: cynb advStart 64 180<cr> RESPONSE: <cr_lf> OK<cr_lf>

<cr_lf>

Note: If the system is already in advertising state, error message show that the system in invalid state for operation. The unit of INTERVAL is minisecond; The unit of TIMEOUT is second, 180 means that BLE advertising will stop after 180 seconds. Default interval value is 64 ms, default time-out value is 180 seconds. INTERVAL range: Maximum: 10240 Minimum:20 TIMEOUT range: Maximum: 16383 Minimum:1

3.8 BLE Stop Advertising

STOP DEVICE ADVERTISING

Function: Stop BLE advertising.

Command Format: cynb advStop

Example:

COMMAND: cynb advStop<cr>
RESPONSE: <cr_lf>
OK<cr_lf>
<cr lf>
</cr

BLE Command Line Interface

Sheet 14 of 31

V1.18 Nov 11, 2016

3.9 TX Power

RF TX POWER	
Function: Set RF TX power for BLE module.	
Command Format: cynb txPow <tx power=""></tx>	
Example: COMMAND: cynb txPow 0 <cr> RESPONSE: <cr_lf> OK;<cr_lf> <cr_lf></cr_lf></cr_lf></cr_lf></cr>	
 Available TX power for NNN40 are -30, -20, -16, -12, -8, -4, 0, 4. (unit: dBm) Available TX power for NQ620 are -20 to +4 dBm in 4 dB steps 	

3.10 BLE Address

BLE Command Line Interface

Sheet 15 of 31

GET BLE Address

Function: Get current BLE MAC address.

Command Format: cynb bleAddr

Example:

COMMAND: cynb bleAddr<cr>
RESPONSE: OK;[E6 BC A1 2B 32 2F];<cr_lf>
<cr_lf>

3.11 BLE GATT Service

GATT SERVICE SETTING

Function: Add SIG defined or Vendor Specific service to server

Command Format: cynb gattService <SERVICE UUID>

Example: COMMAND: cynb gattService 0x180A<cr> RESPONSE: <cr_lf> OK<cr_lf> <cr_lf>

Note: Once one service had added on GATT server, characteristics can be added on, but **once registered new service, user can not add new characteristic in previous set service**. Service UUID can be 4 or 32 hex numbers.

BLE Command Line Interface

Sheet 16 of 31

GATT CHARACTERISTIC SETTING

Function: Add new characteristic on currently add services, including set characteristic UUID, characteristic property and value for BLE module.

Command Format: cynb gattChar <CHAR UUID> <ATTR PROP> <ATTR VALUE>

Example: COMMAND: cynb gattChar 0x2A19 0x12 0x1234<cr>

RESPONSE: <cr_lf> OK<cr_lf> <cr_lf>

Note: The characteristic property currently support multiple properties, including 0x00: NONE 0x01: BROADCAST 0x02: READ 0x04: WRITE_WITHOUT_RESPONSE 0x08: WRITE 0x10: NOTIFY 0x20: INDICATE 0x40: AUTHENTICATED SIGNED WRITES

Select the appropriate and mandatory properties to specific characteristic, using bit mask, for example, if user want to add one characteristic with Notify and Read property, filled with 0x12.

- The total value field length is 10 bytes, equal to 20 hex numbers.
- Attribute value type is uint8_t, so the input hex number must be even number, ex. 0, 2, 4, etc.
- Characteristic UUID can be 4 or 32 hex numbers.
- Cannot add characteristic before not add any service, or error message will show:
 "Invalid state to perform operation."

BLE Command Line Interface

Sheet 17 of 31

REGISTER GATT SERVICE

Function: Register SIG defined or Vendor Specific service to server **Command Format:** cynb regService

Example: COMMAND: (

COMMAND: cynb regService<cr>
RESPONSE: <cr_lf>
OK<cr_lf>

3.12 GATT Write Characteristic Value

UPDATE CHARACTERISTIC VALUE (BLE PERIPHERAL MODE)
Function: Change characteristic value and make an indication or notification according to the property of characteristic.
Command Format: cynb update <service uuid=""> <char uuid=""> <type> <value></value></type></char></service>
Example (1): COMMAND: cynb update 0x180D 0x2A39 0 1234 <cr> RESPONSE: <cr_lf> OK; 31323334<cr_lf> <cr_lf> RESULT: This example update data to 0x31323334, data length have 4 bytes Example (2): COMMAND: cynb update 0x180D 0x2A39 1 0x1234<cr> RESPONSE: <cr_lf> OK;1234<cr_lf> <cr_lf> RESULT: This example update data to 0x1234, data length have 2 bytes</cr_lf></cr_lf></cr_lf></cr></cr_lf></cr_lf></cr_lf></cr>
Note: <type> parameter have following values:</type>

BLE Command Line Interface

Sheet 18 of 31

0 : Raw Data (Not transferred from ASCII code) 1 : Char Data
 If the specified characteristic property contains notify/indicate, data update require BLE Central (ex. mobile phone) enable the notify/indicate descriptor (CCCD) previously. Attribute value type is uint8_t, so the input hex number must be even number, ex. 2, 4, 6, etc. Maximum data length is 20 bytes.
WRITE CHARACTERITSTIC VALUE (BLE CENTRAL MODE)
Function: BLE Central write value to specific characteristics.
Command Format: cynb cenWriteData <service uuid=""> <char uuid=""> <type> <value></value></type></char></service>
Example (1): COMMAND: cynb cenWriteData 0x180D 0x2A39 0 1234 <cr> RESPONSE: <cr_lf> OK; 31323334<cr_lf> <cr_lf></cr_lf></cr_lf></cr_lf></cr>
Example (2): COMMAND: cynb cenWriteData 0x180D 0x2A39 1 0x1234 <cr> RESPONSE: <cr_lf> OK; 1234<cr_lf> <cr_lf></cr_lf></cr_lf></cr_lf></cr>
Note: <type> parameter have following values: 0 : Raw Data (Not transferred from ASCII code) 1 : Char Data</type>
Attribute value type is uint8_t, so the input hex number must be even number, ex. 2, 4, 6, etc. Maximum data length is 20 bytes.

BLE Command Line Interface

Sheet 19 of 31

3.13 GATT Read Characteristic Value

READ CHARACTERITSTIC VALUE (BLE PERIPHERAL MODE)
Function: Read current characteristic value in BLE module.
Command Format: cynb readData <service uuid=""> <char uuid=""></char></service>
Example:
COMMAND: cynb readData 0x180D 0x2A39 <cr></cr>
RESPONSE: <cr_lf></cr_lf>
OK;0x1234 <cr_lf></cr_lf>
<cr_lf></cr_lf>
Note: Max value field contains with 20 bytes, which equal to 40 hex numbers.
READ CHARACTERITSTIC VALUE (BLE CENTRAL MODE)
Function: BLE Central read value of specific characteristics.
Command Format: cynb cenReadData <service uuid=""> <char uuid=""></char></service>
Example:
COMMAND: cynb cenReadData 0x180D 0x2A39 <cr></cr>
RESPONSE: <cr_lf></cr_lf>
OK <cr_lf></cr_lf>
<cr_lf></cr_lf>
[12][34] <cr_lf></cr_lf>
Note: Max value field contains with 20 bytes, which equal to 40 hex numbers.

3.14 GATT Notification

ENABLE NOTIFICATION

Function: BLE Central enable notification of specific characteristics.

Command Format: cynb cenEnNotify <SERVICE UUID> <CHAR UUID>

BLE Command Line Interface

Sheet 20 of 31

V1.18 Nov 11, 2016

Example:	
COMMAND: cynb cenEnNotify 0x180D 0x2A39 <cr></cr>	
RESPONSE: <cr_lf></cr_lf>	
[12] [34] <cr f=""></cr>	
[56] [78] <cr_lf></cr_lf>	
<cr_lf></cr_lf>	
DISABLE NOTIFICATION	
Function: BLE Central disable notification of specific characteristics.	
Command Format: cynb cenDisNotify <service uuid=""> <char uuid=""></char></service>	
Example:	
COMMAND: cynb cenDisNotify 0x180D 0x2A39 <cr></cr>	
RESPONSE: <cr_lf></cr_lf>	
OK; <cr_lf></cr_lf>	
<cr if=""></cr>	

3.15 BLE Scan Start

BLE Command Line Interface

Sheet 21 of 31

Scanning will stop after <TIMEOUT> seconds, if <TIMEOUT> set to 0, disable timeout. Default interval value is 500 ms, default window value is 400 ms, default time-out value is 5 seconds. INTERVAL range: Maximum: 10240 Minimum:3 WINDOW range: Maximum: 10240 Minimum:3 TIMEOUT range: Maximum: 16383 Minimum:1 **<Output Parameters>** <DEVICE_NAME>, ADV,<BLE ADDR>,<RSSI>,<ADV TYPE>, <ADV TYPE> available list as below: 0:ADV_CONNECTABLE_UNDIRECTED, 1:ADV_CONNECTABLE_DIRECTED, 2:ADV_SCANNABLE_UNDIRECTED, 3:ADV NON CONNECTABLE UNDIRECTED

3.16 BLE Scan Stop

STOP BLE SCAN

Function: Stop scanning BLE device.

Command Format: cynb scanStop

Example:

COMMAND: cynb scanStop <cr>
RESPONSE: <cr_lf>
Stop Scanning;<cr_lf>
<cr_lf>

3.17 BLE Connect

PERFORM BLE CONNECT
Function: Connect to specific BLE device by device address.
Command Format: cynb connect <addr></addr>
Example:

BLE Command Line Interface

Sheet 22 of 31

COMMAND: cynb connect 0XE4FEAD218F5B <cr></cr>			
RESPONSE: serviceDiscoveryCallback <cr_lf></cr_lf>			
S UUID-1800 attrs[1 7] <cr_lf></cr_lf>			
C UUID-2a00 valueAttr[3] props[0] <cr_lf></cr_lf>			
C UUID-2a01 valueAttr[5] props[0] <cr_lf></cr_lf>			
C UUID-2a04 valueAttr[7] props[0] <cr_lf></cr_lf>			
<cr_lf></cr_lf>			
to: Connact command will trigger service/characteristic discove			

Note: Connect command will trigger service/characteristic discovery function after connection success.

3.18 BLE Disconnect

BLE DISCONNECTION Function: Disconnect from current BLE connection. Command Format: cynb disconn Example: COMMAND: cynb disconn<cr> RESPONSE: <cr_lf> OK<cr_lf> Cor_lf> Connected<cr_lf> Disconnected<cr_lf>

BLE Command Line Interface

3.19 BLE Data Interrupt

BLE ENABLE DATA INTERRUPT

Function: Enable client write detection, action included showing write data, give interrupt to GPIO PIN and identify write command type.

Command Format: cynb enInt Example: COMMAND: cynb enInt<cr> RESPONSE: <cr |f> OK<cr If> <cr lf> ... w2,180F,2A19,1,22; <cr If> **RESULT:** This example print string list in below sequence, (wX: Write command type), (Service UUID), (Characteristic UUID), (Data length), (Data in Hex) Note: Write command can be listed as below: w0: Invalid operation w1: Write w2: Write without response w3: Signed write w4: Prepare write w5: Cancel all prepared write w6: Execute all prepared write

BLE Command Line Interface

BLE DISABLE DATA INTERRUPT

Function: Disable client write detection

Command Format: cynb disInt

Example: COMMAND: cynb disInt<cr> RESPONSE: <cr_lf> OK<cr_lf> <cr_lf>

BLE Command Line Interface

Sheet 25 of 31

4. BLE Example for creating a profile by command

4.1 Tools Preparation

- **1. Terminal tool:** Because the command line interface uses UART for configuration and communication, you need to install terminal emulator tool such as TERATERM or PUTTY.
- 2. USB to UART convertor: Connect the convertor to 1.8 V or 3.3 V UART output pin.
- **3. BLE APP:** To display the BLE GATT profile created by CLI, you need to install BLE APP (in mobile phone or other BLE central system, at least support BLE 4.0) to verify the configuration and input data. Here we use Nordic's Wireless APP name "nRF Master Control Panel", which can be found on GOOGLE PLAY store for Android system, and APPLE STORE for iOS system.

4.2 Procedure for connecting UART

Use the terminal to choose the correct COM port (the information show on device manager) and set the data rate, also set the local echo on as figure 1 and figure 2. Press the reset button in module and reset module.

Figure 1. Terminal emulator configuration-1

BLE Command Line Interface

Sheet 26 of 31

Line discipline options				
Local echo:				
🔾 Auto	Force on	Force off		
Local line editing:	-	-		
○ Auto	Force on	 Force off 		

Figure 2. Terminal emulator configuration-2

Note: For other com port terminal software tool, enter string may not include "r, therefore user need add it in the end of line.

4.3 Procedure for creating an Profile

BLE sensor device (in this case means Delta platform with glucose sensor) have 6 possible states, when module power on, transit to Initializing state.

After initialization, device transit to Configure state, in this state, Collector can configure device name and BLE address and build desired GATT services, etc.

RF is powered off to conserve energy for a specific time internal (defined in SIG profile) before transit to Advertising state where RF is powered on to send out an advertising packet. Once the transmission of advertising packet is completed, it transit back to Standby. The transition between Standby and Advertising will repeat until the sensor device is connected and transit to Connecting state when the advertising packet is received by central (collector) who intent to connect to this BLE sensor device.

In connecting state, all services such as Glucose service and Device Information Service can be accessed by central. The transition goes back to Standby when the connection is terminated by central or sensor device.

BLE Command Line Interface

Figure.2 BLE state change diagram

Step1. Sensor power on, transit to **Initializing state**. Typically with software reset first, then check the module information and firmware information.

cynb reset cynb info

Step2. Device transit to **Configure state**, configure by collector, with device name and transmit power, user can also build GATT services and characteristics, here 0x1808 correspond to Glucose Service, and Number string after correspond to their characteristics, and data format refer to Reference.1 "Glucose Profile". On the other hand, user may add own vendor-specific services/characteristics UUID in this step.

> cynb name <name length>s <device name string> cynb bleAddr <BLE address 12 Hex> cynb txPow <Integer Value> cynb gattService 0x1808 cynb gattChar 0x2A34 <Property 2 Hex> <Hex Value>

BLE Command Line Interface

Sheet 28 of 31

cynb gattChar 0x2A51<Property 2 Hex> < Hex Value > cynb gattChar 0x2A52 <Property 2 Hex> < Hex Value >

.....

cynb regService

Step3. Glucose Sensor will typically remain powered off between uses, after sleep command execute, device transit to **Sleep state**, and will only advertise and allow a Collector to connect when it is turned on by the user and has data to send, key in any input will make device transit to **Standby state**.

cynb sleep <any key to turn on>

- Step4. Enter GAP connectable mode, device transit to **Advertising state**, sensor start advertising with specific interval and timeout, device waits until Collector initialize connection request. cynb advStart 64 180
- Step5. When device transit to Connecting State, meanwhile connection is established, the Glucose Sensor sends one or more notifications and indications to the Collector, also, if the property with write, Collector can initiatively update stored value in Sensor. User may also use BLE data interrupt function, inform Host for BLE data update from connected BLE device.

cynb update 0x1808 0x2A18 <TYPE> <Value> cynb readData 0x1808 0x2A18 cynb enInt

Step6.When the data transfer is complete the Glucose Sensor typically terminates the connection, device
back transit to Standby state.

cynb disconn

BLE Command Line Interface

Sheet 29 of 31

5. BLE Command Set Summary Table

Command Format	Command Response	Description	
cynb initBleCen	ОК	Init BLE Central stack	
cynb gpio <gpio-no> <set clear=""></set></gpio-no>	ОК	Set or reset (high/low) a GPIO pin	
such clean cCDIO NOS	ОК	Go to system off mode, wake up by
